

Project Name: Talent Tap Pro – Campus Skill-Based Collaboration Engine

1. Introduction

In a college, the students have different skills like coding, designing, and business ideas. Many students also have good project ideas, but they cannot find the right teammates.

Right now, students use WhatsApp, Discord, or posters to find team members. These methods are not effective because messages get lost and many students don't see them.

Because of this, many good ideas are never developed.

This project solves this problem by creating one platform where students can connect based on their skills and work together.

2. Stakeholders

These are the people affected by this problem:

- **Students:**
Skilled students don't find good projects, and beginners don't get chances to learn.
- **Project Creators:**
Students with ideas cannot find the right team members.
- **Faculty / Mentors:**
Teachers cannot properly guide or track student projects.
- **College Community:**
The campus loses innovation because students are not connected.

3. Problems Identified

There are many problems in the current system:

- **No Central Platform:**
Information is spread across WhatsApp, Discord, and notice boards, so it is hard to find opportunities.
- **Students Are Not Connected:**
Skilled students and project creators cannot find each other easily.
- **Difficult Team Formation:**
There is no system to match skills with project needs.
- **Beginners Get No Chance:**
Unskilled students are often left out and don't get learning opportunities.
- **No Project Tracking:**
After forming a team, there is no system to track work or progress.
- **No Skill Verification:**
Anyone can enter any skill, so it is hard to trust the information.

4. Existing System & Its Limitations

Currently, students use informal ways like WhatsApp, Discord, or posters to find teammates and share project ideas.

- **Process:**
A student shares their idea in a group or through messages and waits for responses from others who are interested.
- **Limitation:**
This process is not reliable or organized. Messages can be missed, ignored, or lost. There is no proper system to track who applied, who joined, or which projects are active. This leads to confusion and missed opportunities.

5. Constraints & Assumptions

- **Time Constraint:**

The project is developed within a limited hackathon time, so only core features and basic logic are implemented.

- **Resource Constraint:**

The system uses only free and open-source technologies. No paid tools or APIs are used.

- **Deployment Assumption:**

It is assumed that users have access to a device (laptop or mobile) with an internet connection and a modern web browser.
